

Fluoroscopic Resolution Test Tools

Model L619

Quick check on image/video resolution

The Fluoroscopic Resolution Test Tool provides a quick general check on Image Intensifier or (digital) video system resolution.

Model L619 contains resolution values from 30 LPI to 100 LPI. The mesh groups are purposely arranged in a nonsequential rotational pattern to permit better visualization of the sometimes subtle changes in mesh thickness.

RD/FL Contrast/Resolution Test Tools

Model L656, L647

*Radiographic/Fluoroscopic image
quality & performance*

The RD/FL Phantoms are tools used to easily assess the general radiographic and fluoroscopic image quality and performance of a standard imaging system.

The Model L-647 phantom has three various shaped mesh patterns. Surrounding the mesh pattern are four low contrast targets.

The Model L-656 RD/FL Digital Test Tool allows simultaneous evaluation of resolution, contrast and density uniformity.
